

BPM Collaboration Portal for Microsoft® SharePoint®

Today many organizations worldwide use Microsoft® SharePoint® as a collaboration and intranet platform to share documents. Signavio extends the power of Microsoft® SharePoint® by supporting the publishing of business processes models to your company's Microsoft® SharePoint® server directly. Using Signavio's Process Portal with Microsoft® SharePoint® allows for the seamless integration between process models and the related process documents already available on your computer's intranet.

BPM Collaboration Portal

With Signavio's Process Portal for Microsoft® SharePoint®, you can make your organization's process models accessible to all employees (e.g. quality management), or to a defined community of users. Within the portal, you share and control access to any process model based on individual user's or group's permission settings.

Process governance is also supported by the platform. Following the functional approval of a new or revised process model, the corresponding version of the diagram is published and made accessible in Signavio's Process Portal for Microsoft® SharePoint®.

Any of your models can be updated at anytime, without directly publishing these changes in the Process Portal as all process models are maintained by Signavio's Process Model Editor with complete revision control. Only after its approval, the latest version of the process diagram is made available to all users with access to the portal. Any users who have subscribed to 'follow' these process models will receive an email update notifying them that the model has changed.

Signavio's Process Portal for Microsoft® SharePoint® offers the following features:

- Approval of process revisions prior to publishing
- No client-side software required
- Users can access models without purchasing a Signavio Process Editor license
- Works with Microsoft® Windows® 8 and current browsers, such as Microsoft® Internet Explorer® 10, Safari®, Firefox® and Google Chrome™
- The process portal can be modified to meet the individual needs of your company

Organizations that have not deployed Microsoft® SharePoint® can easily migrate the portal users and all process models to Microsoft® SharePoint® at any time. Signavio's Admin Tool GUI lets you define users and groups and permissions for access controls for all models in a way that is familiar to Windows® System Administrators.

Make your processes accessible to your employees and colleagues. Get the advantage offered combining process models and documentation in one location.
